1. Introduction

Precise information with regard to various characteristics of traffic flow is crucial for proper planning and management of the highway network. Modern methods of pavement design require more than simple estimates of current and future traffic volumes. It is necessary to know the composition of vehicle stream, configuration of axle assemblies for goods vehicles, extent of axle loads, laden weights, load factors, etc. Furthermore, in order to estimate the likely benefit from a particular road improvement or new construction, it is necessary to know the above characteristics and composition of a traffic stream because of differences in operating cost and cost changes among vehicle types. Such information is also crucial for drawing a proper maintenance and enforcement program of a road system. Also the environmental impact of traffic can only be assessed if the spatial and time variations of traffic both by composition and total number are known.

The aspect of variation assumes a huge dimension as variations in traffic flow take place not only from hour to hour (and in fact within the hour), day to day, week to week, month to month and from site to site but there is also variation in the proportion of different types of vehicles.

Proper planning of a transport system requires detailed knowledge of traffic flows. It being impossible to observe and record all traffic system movements, it is necessary to rely on samples. The type of sample required will be determined by the use to which it is to be put but the design of the sample will always be a compromise between accuracy and cost.

Survey design must always be preceded by precise identification of the ultimate purpose of data for a clearly defined study area. Such identification will help define the type of sample and the level of confidence required. The accuracy of the estimated parameter may not be a linear function of the amount of data collected. In fact the improvement is subject to diminishing returns. As the sample size increases, the scatter does not decrease in direct

proportion. To halve the standard error, the sample size has to be quadrupled. This suggests the need for the choice of an optimum amount of data as can give the best possible result for a given set of resource inputs.

Traffic flow defined as the total number of vehicles passing a point in a unit of time is perhaps the most important characteristic of a traffic stream. Traffic flow data is associated with fixed point and is normally expressed in relation to time; the base being determined by the type of information desired and the application in which it is to be used.

The 'Average Daily Traffic' (ADT) is defined as the total volume during a given time period (more than one day and less than one year) divided by the number of days in that time period.

NTRC has conducted countrywide traffic counts and Origin-Destination Surveys to assist in the preparation of National Transport Plans besides developing traffic growth factors and other relationships used in the planning and design of roads and highways in the country. Recognizing their expertise and experience in the field, NH &MP in May, 2008, requested to carry out traffic count surveys on M-1, M-2, M-3 and N-05 (Annex-1). Accordingly classified traffic counts as per the proforma shown in Annex-2 were conducted on 11 survey points in June, 2008 (as per list in Annex-3) and indicated on the map in Annex-4.

In addition to the staff provided by NTRC, NH & MP also provided ten officials for on-the-job training and also to assist in the field enumeration work. Phase-I of the project commenced on 10th June, 2008 and was completed on 29th June, 2008 during which manual classified traffic counts

on N-05 and Motorways (M-1, M-2 & M-3) from Peshawar to Multan were conducted.

2. Staff Training & Pilot Survey

A survey team comprising NTRC staff and NH & MP staff was arranged for the survey. NTRC members used to carry out field surveys and had enough experience to undertake such assignments. However, the task was new to NH & MP staff. Lecture sessions regarding survey methodology and the survey proforma were arranged for them in the NTRC Auditorium followed by pilot surveys on Islamabad Highway and Kashmir Highway. Even during the actual surveys, NH & MP staff were continued to be fully trained and supervised.

3. Methodology Adopted.

A survey team consisting of 24 Enumerators, 2 Relievers, and two Drivers headed by a Research Officer was assigned to carry out the survey.

The team was further divided into 3 groups for three shifts, each spread over 8 hours, to collect traffic flow information for 24-hours at each of the survey point. 8 Enumerators and 1 reliever were deputed in each shift. 4 Enumerators recorded the flow in each direction. Depending on the traffic volume of each category of vehicles, exclusive enumerators were deputed to record the number of vehicles correctly. Synchronized clocks were used to ensure the correct recording of the time. The Shift Incharge was directed to consolidate the forms at the end of the day.

Field staff was provided with all necessary equipment. Hourly classified traffic counts were taken manually in each direction, without any break, for

24 hours at each station. Every possible effort was made to ensure the accuracy of collected data. Frequent surprise visits by NTRC officers were made for inspection and checking of staff performance.

4. **Survey Points**

11 survey points were chosen under phase-I of the program which may be seen at Annex-III (List of Stations) and Anex-IV (Location of Survey Stations on Map). Though the survey points had already been identified on a map, the exact location for each station was physically selected at the site keeping in view the following factors documented in various reference manuals/reports for traffic count surveys.

- (a) Straight section of road should be used free from junctions, entrances, sudden change in width and elevation so that visibility can work at a distance of at least 1 Km on either side of the survey point chosen.
- (b) There should be no stationary vehicles or building nearby the selected point. For the same reason, stretches of road on which parking frequently occurs should be avoided.
- (c) The survey point must be kept well away from schools, playing field, filling stations, parking zones and parks to minimize chances of any type of interference.
- (d) The survey point should be well away from city limits to eliminate the chances of counting local / urban traffic.
- (e) Besides the technical requirement, social needs must also be taken into account. The survey point should not be very far from where food and drinking water is available.

5. Coding, Compiling and Computerization of Traffic Data

The collected field data was edited and necessary codes were assigned to various 'fields' for computerization. Necessary tabulation and compilation was done for statistical analysis. In addition to compiling hourly classified traffic volume by composition and by direction on a 24 hours basis (Annex-5) the following additional conclusions have been drawn by Statistical Analysis of the data. These are as under:-

- (a) 24-Hours Classified Traffic Volume, (a proxy for ADT).
- (b) Working out Peak and lightest Hours and their shares as percentage of ADT
- (c) Hourly Traffic Flow Pattern as observed on N-05 and Motorways
- (d) Percentage Composition by type of vehicle at each location
- (e) Directional Distribution Factors
- (f.) Ratio of 16-Hours volume to 24-Hours volume.
- (g) Standard Deviation and Variance Analysis.

6. 24-Hour Traffic Volume

Tables 6.1 and 6.2 show the total number of vehicles which passed the survey points over a period of 24 hours. By definition, 24-hours traffic flow cannot be taken as Average Daily Traffic (ADT) as the counts are not long enough to take average. However, they can be considered to be a proxy for ADT.

As may be seen from these Tables, the heaviest traffic was recorded on Taxila-Islamabad Section of N-05 (39,393 Veh./Day) followed by Lahore-Gujranwala Section of N-05 (32,765 Veh./Day) and Lahore-Pindi Bhattian Section of M-02 (32,143 Veh./Day).

Table:- 6.1

24 Hours Traffic Volume on N-5

Section	Survey Location	Total No. of Vehicles
Peshawar – Taxila N-05	Near Iqbal Shaheed Toll Plaza Attock	9287 *
Taxila – Islamabad N-05	Near Sangjani Toll Plaza Islamabad	39393
Jhelum – Rawalpindi N-05	Near Jehlum Toll Plaza	26449
Lahore – Gujranwala N-05	Kala Shah Kaku	32765
Khanewal – Lahore N-05	NTRC Survey Station Pattoki	23399
Multan – Khanewal N-05	16 Km short of Multan	13752

*Low due to lawyer's procession and wet weather.

Table:- 6.2

24 Hours Traffic Volume on Motorways

Section	Survey Location	Total No. of Vehicles
Tarnol – Peshawar M1	Near Peshawar Toll Plaza	15088
N-05 to M-2	Near Kala Shah Kaku Toll Plaza on M-2 Bye Pass	12973
Lahore – Pindi Bhatian M-2	Near Ravi Toll Plaza on M-2	32143
Faisalabad – Pindi Bhattian M-3	18 Km after Faisalabad Toll Plaza on M-3	8485
Pindi Bhattian – Rawalpindi M-2	4 Km after Islamabad Toll Plaza on M-2	11967

7. Hourly Flow and Peak Hour Factors

Hourly flow pattern as observed on N-05 and M-2 may be seen in Figures I & II respectively. The flow-curve for N-05 shows two peaks; first at 12 Noon to 1 PM and the second at 5 PM to 8 PM. It touches its lowest point at 3 AM to 6 AM. It is due to this reason that 16-hours traffic flow is normally taken from 7 AM to 11 PM. The flow curve shows a similar pattern as had been experienced by NTRC in the past regarding the study of N-05. Peak Hour Volume (PHV) is a useful parameter for highway engineers and planners. It is mainly used for geometric design with respect to number and width of lanes, channellization and shoulder design etc. It can also be used for determining capacity utilization, locating traffic control devices and evaluating and planning of an effective enforcement regime.

Peak hours and their respective traffic in respect of N-05 stations is shown in **Table-7.1**. The figures reveal that, on an average, 6.4% of the daily flow is contributed by the peak hour on N-05. It is worth mentioning that 6.304% of AADT was found to be contributed by the peak hour when NTRC set up twenty permanent traffic count stations all over the country and analysed 5 years data (Masoud Bakht, 1990). On Motorways (Table 7.2), this average slightly increases by 0.6%. It comes to be 6.8% on M-1. On M-3 it varies from 7.4% to 7.6% whereas on M-2 it shows a percentage of 6.8% followed by 5.7% on M-3.

The maximum and minimum traffic volumes on N-05 and Motorways and proportion of hourly volumes with 24-hour traffic volumes may be seen in Tables 7.3, 7.4 and 7.5 respectively.

8. Directional Distribution Factors (DDF):

Directional distribution is an important factor in Highway Capacity Analysis (HCA) with regard to capacity and level of service because of the interactive nature of directional flow.

Tables 8.1 & 8.2 show the overall DDF as worked out for N-05 and Motorways. These ratios are on hourly basis in respect of each survey point and may be derived from the data in Annex-5.

Table:- 8.1
Directional Distribution of Traffic Flow
(National Highway N-05)

Section	Total No of Vehicles		Total
	Incoming	Outgoing	
Peshawar – Nowshera	4892 (52.7%)	4395 (47.3%)	9287
Taxila – Nowshera	19151 (48.6%)	20242 (51.4%)	39393
Jhelum – Rawalpindi	13660 (51.6%)	12789 (48.4%)	26449
Lahore – Gujranwala	15990 (48.8%)	16775 (51.2%)	32765
Khanewal – Lahore	13440 (57.4%)	9959 (42.6%)	23399
Multan – Khanewal	6544 (47.6%)	7208 (52.4%)	13752

Table:- 8.2
Directional Distribution of Traffic Flow
(Motorways M-1, M-2 & M-3)

Section	Total No of Vehicles		Total
	Incoming	Outgoing	
Tarnol - Peshawar M-1	7694 (51.0%)	7394 (49.0%)	15088
Kala Shah Kaku Link M-2	6312 (48.7%)	6661 (51.3%)	12973
Lahore - Pindi Bhattian M-2	17612 (54.8%)	14531 (45.2%)	32143
Faisalabad - Pindi Bhattian M-3	4659 (54.9%)	3826 (45.1%)	8485
Pindi Bhattian - Rawalpindi M-2	5543 (46.3%)	6424 (53.7%)	11967

9. Daily Traffic By Type of Vehicles:

In general, classified volume is important for estimating highway user revenues, analysis of capacity in determining the effect of commercial vehicles and structural design of the pavement, bridges and other highway/motorway facilities. As described above, manual classified counts were taken as may be seen in detail in Annex-5. The summarized position (in percent) may be seen in Tables 9.1 & 9.2 respectively. Non motorized traffic (Animal Drawn) was quite insignificant on N-05 and zero on Motorways. However, Motor Cycles and Rickshaws, which are prohibited on Motorways, were recorded on N-05 survey points.

On the average, the highest share of 43% of the total flow is contributed by cars on N-05 followed by 11.9% by 2-Axes trucks and 10.7% by two-wheelers. 3-Axle trucks stood at 6.1%. Multi-axle vehicles, including 3-Axles trucks, constitute 9.5% of the total traffic volume.

On the Motorways cars contribute the highest share of 69.5% followed by 6.6% by buses and 5.9% by 2-Axle trucks. Multi-axle Goods vehicles, including 3-Axle trucks constitute 4.4% (Table 9.2).

The result of the data collected by NTRC from 1985 to 1992 on major highways showed the following percentage share contributed by different types of vehicles to the total traffic flow (Masoud Bakht, 1992). A comparison

of these figures with those of Pakistan Transport Plan Study (carried out by NTRC under the technical assistance of JICA and present survey is as under:

<u>Sl. No.</u>	<u>Vehicle Type</u>	<u>NTRC Research (1985-92)</u>	<u>JICA Study (2005)</u>	<u>Present Survey</u>
1.	Car/Jeep, etc.	36.9%	38.5%	43.0%
2.	Goods Vehicles	34.7%	42.8%	33.0%
3.	Buses	20.8%	18.7%	14.1%

Ever increasing Car-ownership rate in recent past years mainly due to leasing plans offered by various financial institutions seems to have changed the composition of traffic streams significantly. Car is now the dominating mode in road transport.

The traffic composition on N-05 and Motorways may be seen in the form of pie diagrams and bar charts in diagrams 3 to 6 respectively.

10. Standard Deviation And Variance Analysis

Theoretically, a good sample should be consistent and should have all prominent characteristics of the population it is derived from. The sample values (field survey data) should not be very much scattered from the population mean. This could be done by calculating dispersion i.e. how much observed values of a sample in a population are spread out. Standard Deviation is a reliable statistical technique to measure the extent to which values of a series/distribution deviate from the mean values. Thus the consistency of the concluded results in terms of averages, percentages, ratios, parameters, etc can best be found by calculating Standard Deviation or Variance. This particular analysis is done in respect of hourly data (Table 10.1 and that for classified composition of traffic flow (Tables 10.2 and 10.3). The smaller is the Standard Deviation or Variance, the more consistent is the distribution.

Table-10.3
Standard Deviation For
Different Types of Vehicles (All Stations)

Vehicles	N-05 Survey Points	Motorway Survey Points
Motor-cycle	5.3	-
M.Cycle Rickshaw	0.5	-
Car/Jeep/Pajero/Taxi/Suzuki etc	9.6	10.8
Suzuki Pickup (Small)	0.4	0.4
Pickup Large (Toyota, Nissan, Datsun etc)	0.8	0.9
Tractor without trolley	0.1	-
Wagon / Hiace/ Transit (upto 24 seats)	2.9	1.5
Mini Truck	1.8	1.5
Bus, Coach (Greater than 24 Seats)	1.2	2.2
Truck (2 Axles)	8.2	4.2
Truck (3 Axles)	4.2	2.3
Tractor with Trolley	0.2	0.1
Truck (4 Axles)	1.0	1.0
Truck (5 Axles)	0.4	0.5
Truck (6 Axles)	0.3	0.3

It is interesting to note that all the three dominating modes i.e. Cars, buses and 2-Axle trucks have very low values of Standard Deviation accounting for 1.4, 2.5 and 2.8 respectively. It indicates the consistent flow of N-05 from north to the south in Multan. NTRC research has shown that the composition does not differ significantly up to Hyderabad, Sindh. However, Super Highway (Karachi – Hyderabad) shows a variation. The composition of ADT for the section as found in June, 2007 as a result of a 14-days traffic counts is as under :-

Table:-10.4
VEHICLE COMPOSITION PERCENTAGES

Sl. No.	Vehicle Class	Super Highway 2007 Survey (NTRC)	Peshawar - Multan 2008 Survey (NTRC)
1.	Motorcycles	1.17	0.90
2.	Cars	32.73	43.00
3.	Buses	11.03	5.40
4.	2-Axle Trucks	14.40	11.90

Regarding the classification of vehicles, National Highway shows more consistency than the Motorway.

11. Co-efficient of Variation:

Though standard deviation or variance is a good and reliable measure of dispersion but the disadvantage is that it is an absolute measure. A relative measure has some more advantages over an absolute one mainly due to the fact that it is free from all types of units of measurement. It is in the form of a ratio, percentage or co-efficient.

Co-efficient of variation is thus a relative measure which is well descriptive and cannot be affected easily by extreme values. It is obtained by dividing standard deviation by mean value and then is multiplied by 100 to get the figure in percentage form.

Table-11 shows the co-efficients of variation in respect of various hours of a day. It is clear that the National Highway-05 not only shows a good consistency in the composition of flow but also reflects a significant consistency in hourly flows. The least co-efficient of variation (5%) comes out for the hour 7 A.M to 8 A.M and 8 P.M to 9 P.M followed by 6% for 11 A.M to noon and from 2 P.M to 3 P.M.

Provision of certain traffic flow factors (having low co-efficients of variation) makes it possible to extend short count. The art of extracting final desirable figures from short counts has been developed to such an extent in the North America and Western Europe that even a 15 minutes count on any highway can be extended to ADT or AADT. Table-11 gives an example of its validity. For instance, one hour count from 7 A.M to 8 A.M (with the lowest variation) on any Tuesday on N-05 at any location from Peshawar to Multan is 850 and as per the survey 3.916% of the total traffic on Tuesday on N-05 (Table 7.5) is contributed by that particular hour. Therefore, the estimated ADT comes to 21,706 vehicles per day. As described earlier in Tables 9.1 and 9.2, classified factors have been given so that ADT can be bifurcated into various classes. As the co-efficient of variation is 5%, it could be said at 90% confidence level that the estimate for ADT is valid.

Table-11
Standard Deviation of Hourly Flow
National Highway N-05

Hours	St.Deviation	Coefficient of Variation (%)
0000-0100	0.6	20.0
0100-0200	0.5	16.7
0200-0300	0.5	25.0
0300-0400	0.3	15.0
0400-0500	0.3	15.0
0500-0600	0.3	15.0
0600-0700	0.5	16.7
0700-0800	0.2	5.0

12. Ratio of 16-Hours Volume to 24-Hours Volume

A common approach to reduce survey cost and manpower requirement is to use the ratio of 16-hours volume to 24-hours volume. The normal practice is to take the period from 7 A.M to 11 A.M for 16-hours counts. However, reliable Composition Factors, must be used simultaneously if these ratios are applied. Though the reliability of data is affected by 10% - 20%, by this method, the cost can be minimized significantly. The technique can only be recommended when a survey is carried out with limited resources and the complementary desired factors have already been derived from actual surveys. The following table reveals these ratios.

Table 12.1
Ratio of 16- Hours Traffic to 24 Hours Traffic
(National Highway N-05)

S.No	Section	Total No of Vehicles		Total	16- Hour Count Ratio
		16 Hours Total From 0700 to 2300	8 Hours Total from 2300 to 0700		
1	Peshawar - Nowshera	8062	1225	9287	1.152
2	Taxila – Nowshera	34007	5386	39393	1.158
3	Jhelum – Rawalpindi	21757	4692	26449	1.216
4	Lahore – Gujranwala	27336	5429	32765	1.199
5	Khanewal – Lahore	19268	4131	23399	1.214
6	Multan – Khanewal	11158	2594	13752	1.232

Table:- 12.2
Ratio of 16- Hours Traffic to 24 Hours Traffic
(Motorways M-1, M-2 & M-3)

S.No	Section	Total No of Vehicles		Total	16- Hour Count Ratio
		16 Hours Total From 0700 to 2300	8 Hours Total from 2300 to 0700		
1	Tarnol - Peshawar M-1	13888	1200	15088	1.086
2	Kala Shah Kaku Link M-2	11248	1725	12973	1.153
3	Lahore - Pindi Bhatian M-2	27751	4392	32143	1.158
4	Faisalabad - Pindi Bhattian M-3	6684	1801	8485	1.269
5	Pindi Bhattian - Rawalpindi M-2	9805	2162	11967	1.220

13. SALIENT RESULTS

Following are some salient results of the analysis:

- a. Cars (43%) and 2-Axle Truck (11.9%) are the dominating modes on N-05 whereas cars (70%) and buses (6.6%) dominate the composition of traffic stream on Motorways.
- b. Goods vehicles contribute about 21 percent of the total traffic on N-05, while 2-Axle rigid trucks account for about 57% of the total goods vehicles.
- c. There is a high consistency in the composition of traffic flow on various sections of N-05 from Peshawar to Multan. Enough traffic counts have not been conducted on Motorways to conclude such results.
- d. There is a significant consistency in terms of hourly contribution on N-05. This leads to the use of short term counts or to use 16- hour traffic volume ratios for robust estimates of ADT. The study of motorways however is too short to workout such factors.

- e. Standard Deviation, Variance and Co-efficient of Variation analysis reveals that 24-Hour Traffic flows for Peshawar to Multan section of N-05 can be extrapolated from above developed factors with 90 percent confidence level.

14. Recommendations

The recommendations are as under:

1. Traffic counts should be conducted on a regular basis as per the methodology explained in this report on all the important sections of Motorways and National Highways.
2. Traffic counts conducted on Saturdays and Sundays should be repeated at least once more on any week day at that particular survey point.
3. Coverage of motorways should be extended (both in spatial and temporal domains).

LIST OF ANNEX

- Annex-1 : NH & MP Letter for conducting the survey
- Annex-2 : Survey Questionnaire
- Annex-3 : List of Survey Points
- Annex-4 : Map Indicating Survey Points
- Annex-5 : 24 Hours Traffic Volume (Hourly)
- Annex-6 : Survey Photographs

Government of Pakistan
Ministry of Communications
National Highways & Motorway Police
(Road Safety Wing)

No. AA-O-02/07/1285

Islamabad, the 24th April 2008

Subject: Zone-wise Traffic Count Survey.

In order to take preventive measures against accidents, multi-dimensional accident analysis is done by NH&MP. The data regarding exact traffic count forms the basis for accurate analysis. Unfortunately, neither NHA nor NH&MP has adequate facilities to conduct traffic count surveys. Presently, the traffic count available with NH&MP is not based on some scientific evidence/ facts.

2. Since the NTRC has the expertise in the field, therefore it is requested that a suitable team may be deputed for zonewise traffic count surveys to be conducted in collaboration with concerned NH&MP field staff. The survey would form basis for framing future operational policy including sanction of resources, upgradation administrative arrangements with regard to the sizes of beats, sectors and zones, etc.

3. An early response in the matter is requested so that a survey schedule can be prepared.

The Chief NTRC,
Ministry of Communication,
Islamabad.
